

Name _____

Date _____

9.3 Database

A theatre has a number of shows booked for upcoming months. Only one show takes place on each date. The theatre stores information about the shows in a database including:

- date
- show name
- type, e.g. comedy
- length.

It also stores the tickets that have been booked in a database including:

- booking ID
- date
- number of tickets
- name for booking
- telephone number
- paid (Yes or No).

Getting started

Identify an appropriate field name for each of the data items in each of the two database tables.

Give each table a suitable name.

Select an appropriate data type for each of the fields.

Select an appropriate primary key for the database.

Practice

Create two database tables in the database software of your choice, using the information you decided in the Getting started activity.

Write SQL scripts to return:

- 1 the number of tickets booked for a specific date
- 2 the telephone numbers of all bookings that have not been paid for
- 3 all of the shows in December.

Challenge

Identify **four** pieces of information you want to gather from the data.
Write an SQL script for each of these requirements.
